Hearing Protection Information Sheet

For questions contact Risk Management, Gwen Butler at gwen.butler@northwestern.edu or 847.491.4936.

Hearing protection must be worn by the following personnel:

- Employees exposed to an 8-hour TWA of 85 dBA or more who have not yet had a baseline audiogram
- Employees exposed to an 8-hour TWA of 85 dBA or more who have experienced a standard threshold shift
- All employees exposed to an 8-hour TWA of 90 dBA or more

Northwestern recommends that all employees entering a space where noise exposure may exceed 90 dBA wear hearing protection, regardless of duration of exposure.

Hearing Protection Comparison

<table>
<thead>
<tr>
<th>Type</th>
<th>Sample Image</th>
<th>Advantages</th>
<th>Disadvantages</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ear Muffs</td>
<td></td>
<td>➢ More consistent protection &lt;br&gt; ➢ Usually last longer than ear plugs</td>
<td>➢ Protection level is decreased when wearing eye/safety glasses because the muff seal around the ear is broken by the eyeglass temple piece &lt;br&gt; ➢ Can be uncomfortable to wear for long periods in hot/humid environments</td>
</tr>
<tr>
<td>Ear Plugs</td>
<td></td>
<td>➢ Can be worn with glasses &lt;br&gt; ➢ More comfortable in hot/humid environments &lt;br&gt; ➢ Offer higher attenuation than most muffs</td>
<td>➢ Must seal well/fit properly to ensure adequate protection</td>
</tr>
</tbody>
</table>

Noise Reduction Rating (NRR)

Noise Reduction Rating (NRR) is a unit of measurement used to determine the effectiveness of hearing protection devices to decrease sound exposure within a given working environment. The higher the NRR number associated with a hearing protector, the greater the potential for noise reduction.

Attenuation is the estimated reduction in the noise level at the eardrum. A 7 dB subtraction to the NRR is used for A-weighted measurements, which is the weighting of sound most similar to human hearing. A 50% safety factor adjusts labeled NRR values for workplace conditions and is used when considering whether engineering controls are to be implemented. The 50% safety factor produces the most reliable results but is not used for enforcement purposes.

Estimated dBA exposure = TWA (dBA) – [(NRR – 7) x 50%]

e.g. If an employee is exposed to a TWA of 92 dBA and is wearing ear plugs with an NRR of 31, then their actual exposure would be 92 – [(31-7) x 0.50] = 80 dBA

Single/Double Hearing Protection

Dual hearing protection involves wearing two forms of hearing protection simultaneously (e.g. earplugs and ear muffs). Using double protection will add 5 dB of attenuation.

e.g. Using the same example as above, if the employee adds NRR 30 ear muffs over the NRR 31 ear plugs, the employee will have 80 dBA exposure minus an additional 5 dBA for a final exposure of 75 dBA.
